In this reply to Rossiter (2018), we note that the goal of developing Journal Article Reporting Standards has been to specify the kinds of information that should be provided to the readers of scientific articles in order to allow maximal understanding of the work being reported—in the case of psychometrics, information that demonstrates the underlying adequacy of the measures used in the research being reported. Although we illustrate some kinds of items that might be utilized to make these demonstrations, the illustrations are not proscriptive.

Keywords: reporting standards, psychometrics

Our primary concern in the psychometric section of Journal Article Reporting Standards (JARS)−Quantitative (Appelbaum et al., 2018) was to highlight the importance of the author(s) of an article reporting on and demonstrating the underlying adequacy of the measures used in the research being reported. We chose to illustrate means of accomplishing this reporting by referring to the currently accepted standards of the field—ones that have appeared in the *Publication Manual of the American Psychological Association* (American Psychological Association, 2010), ones that are specified in *Standards for Education and Psychological Testing* (American Psychological Association, American Educational Association, & National Council on Measurement in Education, 2014), and ones that appear in the standard textbooks in the field (e.g., Urbina, 2014). Similarly, we chose to focus primarily on reliability.

If authors wish to utilize other approaches to establish and demonstrate this adequacy, they are certainly free to do so, provided they offer readers and reviewers a full and transparent description of their approaches. Decision about the adequacy of these approaches, as with all aspects of articles submitted to journals, rests with the reviewers and editors.

Throughout JARS we attempted to highlight the currently accepted standards of the field. Deliberately, we viewed JARS as not a place to reflect upon and adjudicate current controversies in the field. Many exist.
